S2405-2

ILLINOIS ECONOMIC SUMMARY

ILLINOIS DEPARTMENT OF COMMERCE AND COMMUNITY AFFAIRS

HIGHLIGHTS: FIRST QUARTER 1994

The Illinois Economic Summary includes data on various national, state and in some cases local economic indicators. The information is primarily reported annually and by quarter for the last two years. The highlights below summarize recent state and U.S. quarterly trends.

GROSS STATE PRODUCT: The slight decline in the second quarter Gross State Product reflected the initial effects of the summer flooding in the state. This constant dollar quarterly decrease followed eight consecutive quarterly increases. WEFA is projecting that 1993 will be a level year for the state with 1994 growth matching the U.S. rate, surpassing it in 1995 and dipping slightly below it in 1996.

PERSONAL INCOME: There was a rebound in personal income in the second quarter after probable tax related shifts during the previous two quarters. Both DRI and WEFA are forecasting higher increases for the state through 1995, while differing on Illinois' direction in 1996.

LABOR FORCE: The state's unemployment rate in the fourth quarter of 1993 has improved markedly over the previous quarter and was the first time in a year that the Illinois rate was below the national average. 1994-1995 projections for the state show a gradual decline in the unemployment rate with a small increase in 1996. Fourth quarter employment neared a record level with 5,746,000 persons employed, placing it second in comparison to the 5,754,000 average of a year ago.

CONSUMER PRICE INDEX: The Chicago and U.S. annual rates remained moderate in 1993 at 3.1 percent and 3.0 percent respectively. Forecasts indicate this trend may continue through 1996.

RETAIL SALES: The state continued a sedate growth trend that was below the U.S. increase during the first three quarters of 1993. WEFA projects that the state's annual growth rate will improve through 1996 when it is forecast to surpass the national average.

PURCHASING MANAGERS SURVEY: This Chicago business barometer moved from 52 in the third quarter, to 62 in the fourth quarter of last year, to reach its highest level in over five years. The U.S. survey rose to 56 in the fourth quarter, returning to a level it had previously held in the first quarter of 1993.

DIRECT EXPORTS: Positive gains in exports have been achieved in four consecutive quarters. The third quarter exports set a quarterly record, surpassing the previous mark by over $100 million.

1993 POPULATION

The U.S. Bureau of the Census by law must release state population estimates from July, by the end of each calendar year. Their 1993 estimate is reported in a table below and shows an increase from the 1992 figure. Illinois' population had been growing very slowly since the 1970's, when compared to the nation. In the past few years, both rates of growth have moved closer as shown in the following table:

Percent Change

	1970-1980	1980-1990	1990-1993
IL	2.8%	.05%	2.2%
U.S.	11.5%	9.8%	3.4%

Since fertility and mortality trends in the state's population have not differed significantly from the nation, most attention has been focused on the population's migration rates to explain the disparity between Illinois and U.S. growth trends. Net migration has been the following for the state during the past years:

	Net Migration	Average Annual Migration	Percent of Population
1970-1980	-414,000	-41,400	-0.4%
1980-1990	-804,000	-80,400	-0.7%
1990-1993*	-27,000	-9,000	-0.1%

A recent report from the U.S. Bureau of the Census seems to suggest that the state's negative net migration may be slowing. They report that from July 1992 to July 1993 the state's net migration was only -3,000. With stronger population growth reported by the Census in both 1992 and 1993 we may be seeing the reversal of a trend, but a few more years of data will be needed to make a determination.

Population (thousands)

							Percent Change	
	1970	1980	1990	1991	1992	1993	91-92	92-93

ILLINOIS ECONOMIC SUMMARY

Second Quarter
1994

Illinois Department of Commerce and Community Affairs

ILLINOIS ECONOMIC SUMMARY

ILLINOIS DEPARTMENT OF COMMERCE AND COMMUNITY AFFAIRS

HIGHLIGHTS: SECOND QUARTER 1994

The Illinois Economic Summary includes data on various national, state and in some cases local economic indicators. The information is primarily reported annually and by quarter for the last two years. The highlights below summarize recent state and U.S. quarterly trends.

GROSS STATE PRODUCT: The third quarter Gross State Product rebounded solidly after a slight decline in the second quarter. The 4.2 percent third quarter constant dollar increase was above the comparable 2.9 percent gain for the U.S. WEFA is projecting that the 1993 GSP will be 2.4 percent for Illinois with the 1994 rate increasing by an estimated 4.5 percent.

PERSONAL INCOME: After vigorous second quarter growth, the third quarter personal income moderated to a 1.5 percent annualized gain. Growth was hampered by a reduction in federal farm payments and the widespread summer flooding. Both DRI and WEFA are projecting personal income gains in 1993 and beyond to be close to the national averages.

LABOR FORCE: The state's unemployment rate of 6.3 percent in the first quarter of 1994 was the lowest in three years. In the last two quarters, the number of unemployed decreased nearly 83,000 and total employment increased nearly 150,000. Last November, Illinois' unemployment rate dropped below the national average where it has remained. Both DRI and WEFA are projecting similar positioning for the state during the next three years.

CONSUMER PRICE INDEX: The Chicago and U.S. quarterly rates continued their downward trend in the first quarter at 2.3 and 2.5 percent, respectively. This was their lowest level in seven years. Forecasts indicate that these rates will remain moderate through next year.

RETAIL SALES: A record setting fourth quarter boosted annual retail sales to 2.7 percent above the previous years receipts, but below the U.S. average. WEFA is forecasting Illinois retail sales to increase about 7 percent the next two years and estimate that growth will surpass the national average both years.

PURCHASING MANAGERS SURVEY: This Chicago business barometer averaged 62.1 in the first quarter, reaching its highest level in nearly six years. All seven categories of the survey recorded two consecutive quarterly increases with the exception of prices, which went from 60 to 48 and back up to 58 in three successive quarters. Nationally, the comparable index rose to 57 for its second consecutive increase.

DIRECT EXPORTS: A new quarterly shipment record was set in the fourth quarter as Illinois exports reached nearly $5.4 billion. The U.S. Department of Commerce, using a new headquarter based method of tabulation, credited the state with nearly $20 billion in exports last year. The annual amount was also a record as it exceeded the previous year by nearly $4.4 billion.

BAROMETERS OF ILLINOIS ECONOMIC ACTIVITY

In Cooperation with
Dr. Anthony F. Liberatore, Millikin University

Indicators which might lead Illinois economic activity depicted changing economic patterns in early 1991, seemingly anticipating an upturn in production and employment. Coincident indicators suggest that the Illinois economy did indeed bottom out in early 1992 and is now on a sustained upward trend of expansion.

This section presents some Illinois economic times series that are similar to the barometric measures used for monitoring national business cycle events. While these state specific series have not been tested for their consistency in predicting turning points in Illinois economic activity, they nevertheless help tell a story about the prevailing tendencies in the Illinois economy and thus help put often reported economic data into perspective.

The national Index of Leading Economic Indicators, as reported in the Survey of Current Business (U.S. Department of Commerce), has 11 component series. You may think of these as falling into the following acronym -- POEM: Prices, Orders, Expectations and Money. The leading indicators are related to sensitive PRICES such as raw materials and commodities. This is because the pressures of demand and supply are felt first and most acutely in the early stages of production. ORDERS reflect what is in the pipeline of production and indicate activity will take place in the future to fulfill these orders. Important in this group are orders for durable goods, equipment and housing. Economic decisions are often made on EXPECTATIONS about the future as is clearly seen in the general relationship between stock market prices and economic activity. Investors tend to bid up stock prices prior to the end of a recession in order to take advantage of low prices and expected appreciation. Although the relationship of MONEY to the economy is hard to pin down precisely, expansion in the supply of money tends to signal a willingness by the Fed to encourage economic growth. It is often thought that the rate of growth in M2 money (currency, checks and small savings deposits) leads general economic activity by 6 to 12 months.

The most readily available state specific time series are grouped in the category of ORDERS. Reported here are Permits for New Housing Construction, and the Chicago-based Purchasing Managers Index. Two other series that tend to lead national economic events and are readily available for Illinois are Average Weekly Hours in Manufacturing, and Initial Unemployment Claims.

Coincident economic indicators tend to mirror current or contemporaneous conditions in the economy. They tell you where the economy is, not where it is headed. These fall under the acronym -- PIES: Production, Income, Employment and Sales (manufacturing and trade sales). These series reflect what is actually happening in the economy today and thus tend to confirm the state of affairs and coincide with cyclical turning points. We report the statewide series on Nonagricultural Employment.

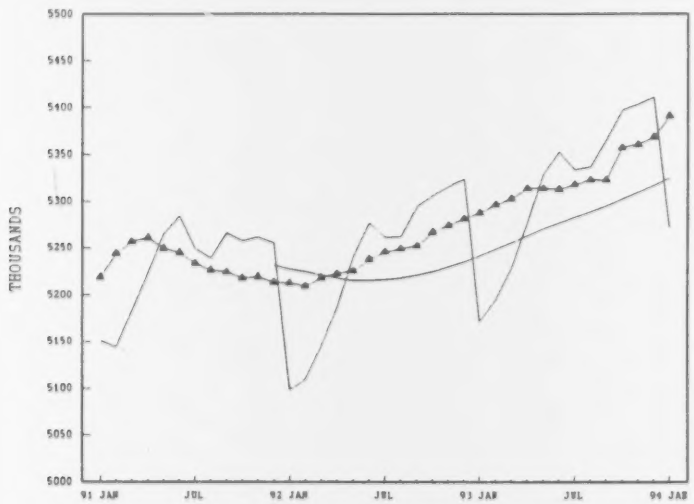
The data series presented in the following tables are adjusted in several ways. Many economic time series tend to reflect regular seasonal patterns within the year. When these patterns are relatively consistent from year to year they can be taken out of the time series to reveal more accurately the underlying trends in activity. Even with seasonal influences removed, however, we should be aware of

the fact that the data may have a significant irregular component. One way to isolate the underlying trend in a data series is to take a double moving average of it. This tends to move seasonality and irregularity out of a time series. Unfortunately, such an approach requires centering the average of yearly data in the middle of the year thus making the average lag far behind the most current observations. Instead we approximate trend by averaging the current and preceding ll monthly or three quarterly observations to create what is called a trailing (as opposed to centered) moving average.

CURRENT INDICATOR

Illinois employment patterns are highly seasonal. The seasonally adjusted values (symbols) show that nonagricultural employment signaled a change in trend by crossing over its moving average in early 1992. It remains on a steady upward trend above its moving average with some nice gains in late 1993.

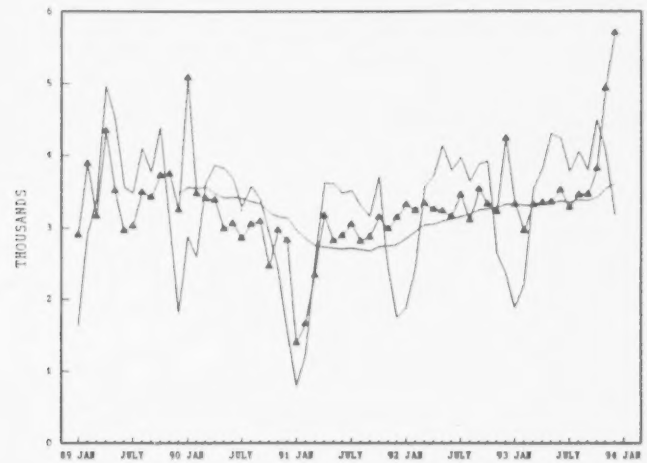
Illinois Nonagricultural Employment
Unadjusted, Seasonally Adjusted (Symbols) & 12 Month Moving Average



LEADING INDICATORS

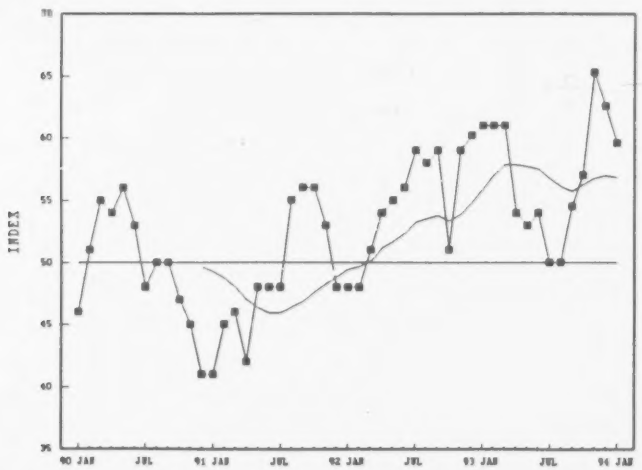
Housing permits in Illinois are also highly seasonal. Both the raw and seasonally adjusted data crossed over the moving average in early 1991, well in advance of the upturn in current indicators, giving some signs of an emerging recovery in the Illinois economy. Permit activity rose very sharply in late 1993 adding to the view of a strengthening expansion in the state.

Illinois Housing Permits
Unadjusted, Seasonally Adjusted (Symbols) & 12 Month Moving Average



The Purchasing Managers Index and its trailing moving average began rising in early to mid 1991. The index itself crossed over its reference line (at a value of 50) by mid year in advance of the increase in nonagricultural employment. By 1992 the moving average of the index crossed over the reference line leaving no doubt about the expansion and its current continuation.

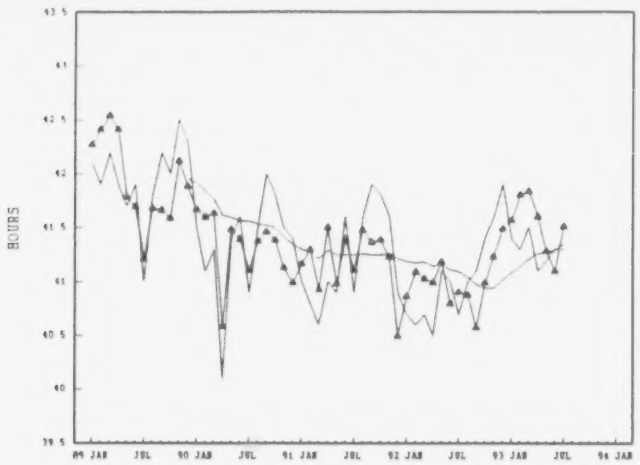
Chicago Purchasing Managers Index (> 50 = Expansion)
Index (Symbols), 12 Month Moving Average & Reference Line



Manufacturing hours vary in a relatively narrow range making them more difficult to read. On a national level average weekly hours tend to decline before the general economy dips into recession. The Illinois series, however, flirted with crossing over its moving average and changing trend in 1991, but it didn't

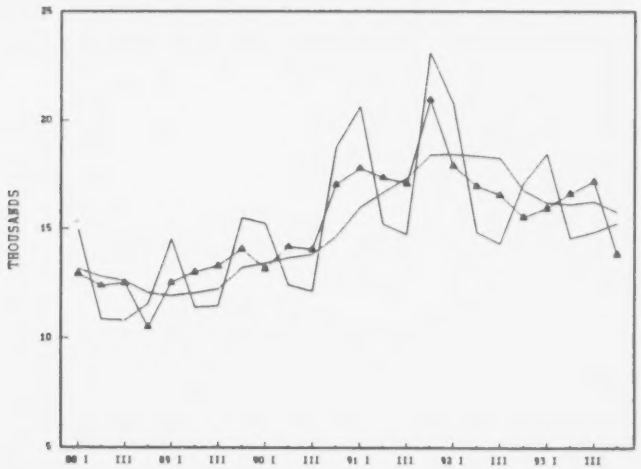
stick. It was not until mid to late 1992, coincident with the upturn in statewide economic activity, that manufacturing hours began trending upward.

Illinois Manufacturing: Average Weekly Hours
Unadjusted, Seasonally Adjusted (Symbols) & 12 Month Moving Average



Unemployment claims also tend to lead economic events. The Illinois series began increasing in the first part of 1989, a sign of economic weakness and recession; it topped out in the third quarter of 1991, two quarters ahead of the turnaround in Illinois nonagricultural employment.

Illinois Initial Unemployment Claims
Unadjusted, Seasonally Adjusted (Symbols) & 4 Quarter Moving Average



ILLINOIS ECONOMIC SUMMARY

Third Quarter
1994

Illinois Department of Commerce and Community Affairs

ILLINOIS ECONOMIC SUMMARY

ILLINOIS DEPARTMENT OF COMMERCE AND COMMUNITY AFFAIRS

HIGHLIGHTS: THIRD QUARTER 1994

The Illinois Economic Summary includes data on various national, state and in some cases local economic indicators. The information is primarily reported annually and by quarter for the last two years. The highlights below summarize recent state and U.S. quarterly trends.

GROSS STATE PRODUCT: The fourth quarter Gross State Product posted another solid gain after a small decline in the second quarter. The 4.2 percent fourth quarter constant dollar increase boosted the 1993 average to 3.1 percent, which was slightly above the comparable 3.0 percent gain for the U.S. WEFA is projecting that the 1994 GSP increase will be an estimated 3.8 percent for Illinois.

PERSONAL INCOME: After wide quarterly weather related variations, the fourth quarter personal income surged to a 9.7 percent annualized gain. Growth in 1993 averaged 4.5 percent for the state compared to 4.7 percent nationally. For 1994 DRI is projecting a 6.5 percent personal income increase for Illinois which is slightly above their estimate for the U.S. WEFA has projected a reverse positioning for the state and the nation in 1994.

LABOR FORCE: The state's unemployment rate of 5.4 percent in the second quarter of 1994 was the lowest in fifteen years. From a year ago, the number of unemployed decreased by 151,000 and total employment increased by 217,000. Last November Illinois' unemployment rate dropped below the national average where it has remained. Both DRI and WEFA are projecting a similar placement for the state in the next three years.

CONSUMER PRICE INDEX: The Chicago and U.S. quarterly rates continued their downward trend in the second quarter at 1.7 and 2.4 percent, respectively. This was their lowest level in eight years. The June report and forecasts indicate that these rates should remain moderate.

RETAIL SALES: An upturn in the first quarter moved retail sales to 4.6 percent above a similar period in 1993. WEFA is forecasting Illinois retail sales to increase moderately this year and estimate that growth will surpass the national average the next two years.

PURCHASING MANAGERS SURVEY: This Chicago business barometer averaged 67 in the second quarter, reaching its highest level in over six years. All seven categories of the survey recorded three consecutive quarterly increases with the exception of prices which have risen noticeably the past two quarters but still remain below the level of a year ago. Nationally the comparable index rose to 58 for its third consecutive increase.

DIRECT EXPORTS: Another quarterly shipment record was set in the first quarter as Illinois exports reached nearly $5.5 billion. The U.S. Department of Commerce, using a new headquarter based method of tabulation credited the state with a 14.9 percent gain over the first quarter of last year.

BAROMETERS OF ILLINOIS ECONOMIC ACTIVITY

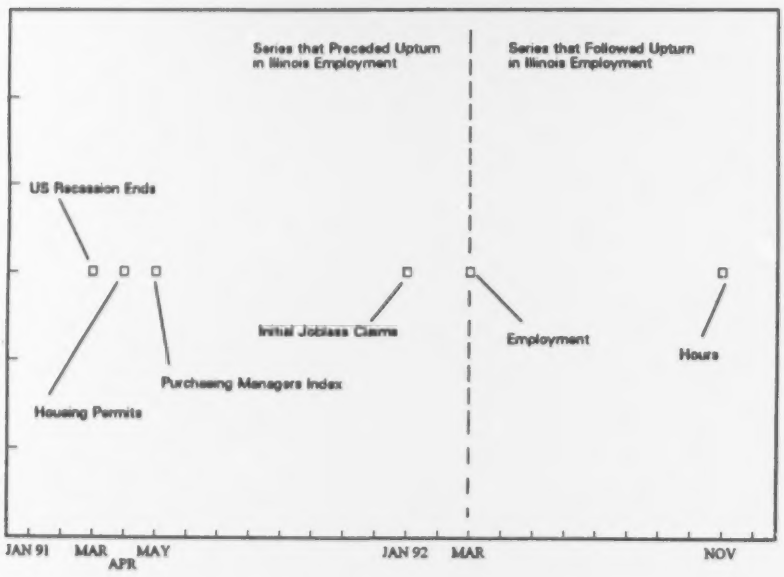
In Cooperation with
Dr. Anthony F. Liberatore, Millikin University

Illinois economic indicators are signaling continued economic growth and future expansion.

In our last issue we presented a brief explanation of leading and coincident indicators as a basis for the few Illinois indicators we have selected to review. This issue updates five selected series.

The first chart shows the turning points of Illinois data series relative to the official end of the US recession marked in March 1991. Employment in Illinois began an upward trend in March 1992, a full year after the US recession was over. Preceding the turnaround in Illinois employment were turnarounds in Housing Permits, The Chicago Purchasing Managers Index and Unemployment Claims. Following the turnaround in Illinois employment was a turnaround in Manufacturing Hours Worked.

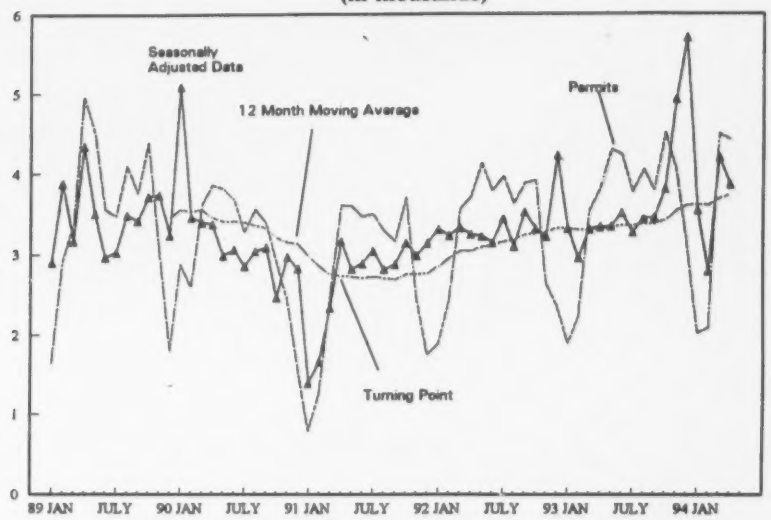
Upward Turning Points in Illinois Data Series Relative to the End of the US Recession



LEADING INDICATORS

Housing permits led the upturn in Illinois employment by 11 months and provided an early signal that economic conditions were improving. Permits remain above their rising moving average marking good prospects for continued growth.

Illinois Housing Permits
(in thousands)

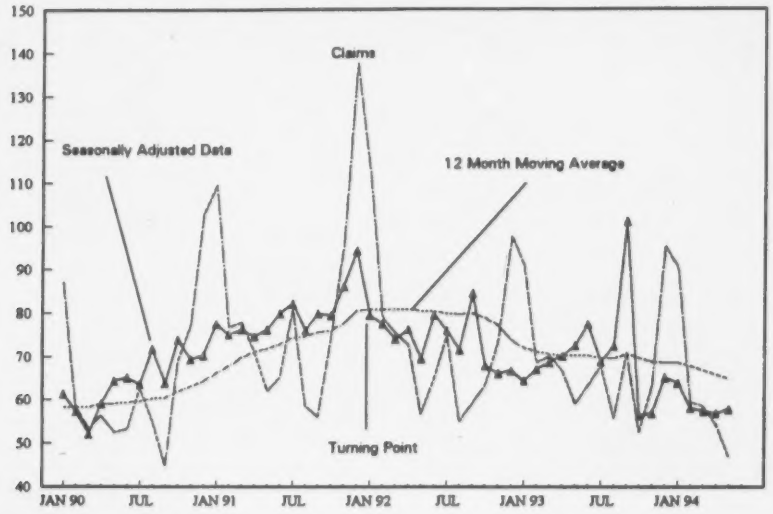


Chicago Purchasing Managers Index (> 50 = Expansion)

The Chicago Purchasing Managers Index displayed several signals of growth, the first coming in May 1991 when it crossed over its moving average. This was 10 months ahead of the upturn in employment.

Unemployment claims fell below its moving average in January 1992, anticipating improving labor market conditions. The trend in initial unemployment claims is declining, another sign of future labor market strength.

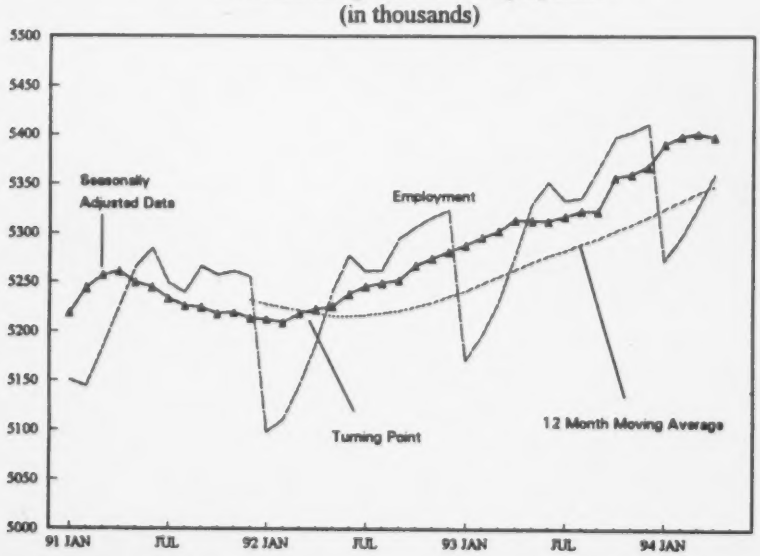
Illinois Initial Unemployment Claims



CURRENT INDICATOR

Illinois employment, crossing over its moving average in March 1992, remains above its moving average reflecting an expanding Illinois Economy.

Illinois Nonagricultural Employment
(in thousands)



LAGGING INDICATOR

Nationally, manufacturing hours worked tend to lead cyclical turning points. The Illinois series, however, lagged the turning point of the last recession. It flirted with reversing trend in 1991, creating a whipsaw pattern around trend. The turning point in hours worked occurred around November, 1992. Nevertheless, hours worked are now near their 1989 levels when employment reached a record annual high.

ILLINOIS ECONOMIC SUMMARY

Fourth Quarter
1994

Illinois Department of Commerce and Community Affairs

ILLINOIS ECONOMIC SUMMARY

ILLINOIS DEPARTMENT OF COMMERCE AND COMMUNITY AFFAIRS

HIGHLIGHTS: FOURTH QUARTER 1994

The Illinois Economic Summary includes data on various national, state and in some cases local economic indicators. The information is primarily reported annually and by quarter for the last two years. The highlights below summarize recent state and U.S. quarterly trends.

GROSS STATE PRODUCT: The five percent first quarter Gross State Product gain was the third consecutive quarterly increase. The first quarter constant dollar rise was above the comparable 3.3 percent gain for the U.S. WEFA is projecting that the 1994, 1995 and 1996 GSP increases will be 3.1 percent for Illinois.

PERSONAL INCOME: After wide quarterly variations last year, the first half personal income posted a solid 6.7 percent annualized gain. This compares to a 6.5 percent increase nationally. For 1994, DRI is projecting 5.4 percent personal income increase for Illinois while WEFA is estimating a 5.5 percent gain.

LABOR FORCE: The state's unemployment rate of 5.9 percent in the third quarter of 1994 was the second lowest in almost four years. From a year ago, the number of unemployed decreased by 110,000 and total employment increased by 87,000. Last November Illinois' unemployment rate dropped below the national average where, with a one month exception, it has remained. Both DRI and WEFA are projecting a similar placement for the state in the next three years.

CONSUMER PRICE INDEX: The Chicago and U.S. quarterly rates appear to have bottomed out and are trending upward in the third quarter at 2.3 and 2.9 percent respectively. Forecasts indicate that these rates should increase slightly but remain relatively low.

RETAIL SALES: An upturn in the first half moved retail sales to 4.0 percent above a similar period in 1993. WEFA is forecasting Illinois retail sales to increase 5.1 percent this year and estimate that growth will rise to 5.9 percent in 1995 and 6.5 percent in 1996.

PURCHASING MANAGERS SURVEY: This Chicago business barometer moderated to 63 in the third quarter after surging to 67 the previous period. Prices among the various categories have risen noticeably the past three quarters to 74 reaching their highest level in nearly six years. Nationally the comparable index returned to its first quarter level of 57 after reaching 58 the previous quarter.

DIRECT EXPORTS: Another quarterly shipment record was set in the second quarter as Illinois exports surpassed $5.7 billion. The U.S. Department of Commerce, using a new headquarter based method of tabulation, credited the state with a 18.7 percent gain over the first half of last year.

BAROMETERS OF ILLINOIS ECONOMIC ACTIVITY

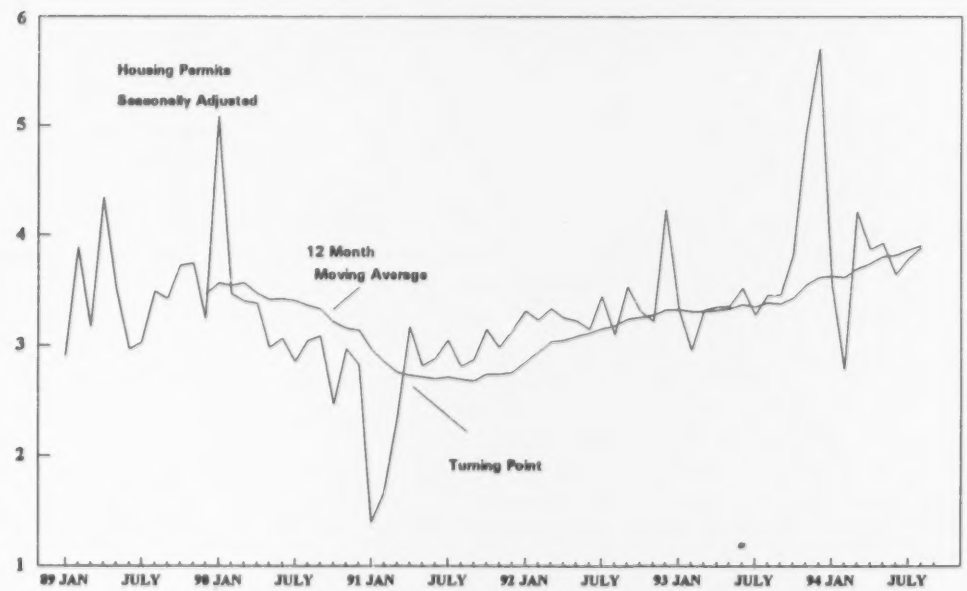
In Cooperation with
Dr. Anthony F. Liberatore, Millikin University

Illinois economic indicators paint a picture of a growing economy. Although some suggest the economy is slowing, the evidence through the first half of this year and the third quarter for the Chicago Purchasing Managers Index was not strong enough to suggest a slowdown was underway.

LEADING INDICATORS

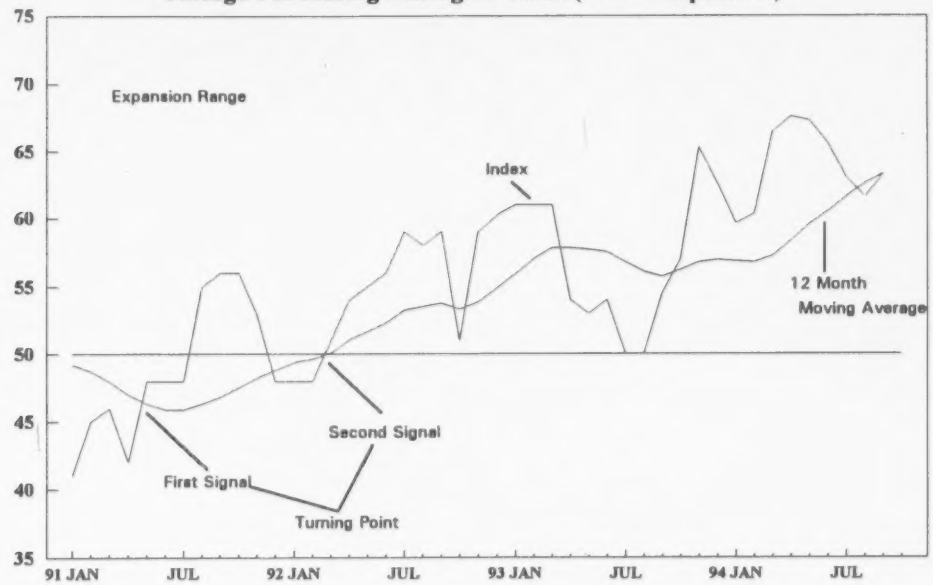
Although seasonally adjusted housing permits fell below their 12 month moving average in June, July and August the dip is not strong enough to suggest that the trend in permits has turned down.

Illinois Housing Permits, Seasonally Adjusted
(in thousands)



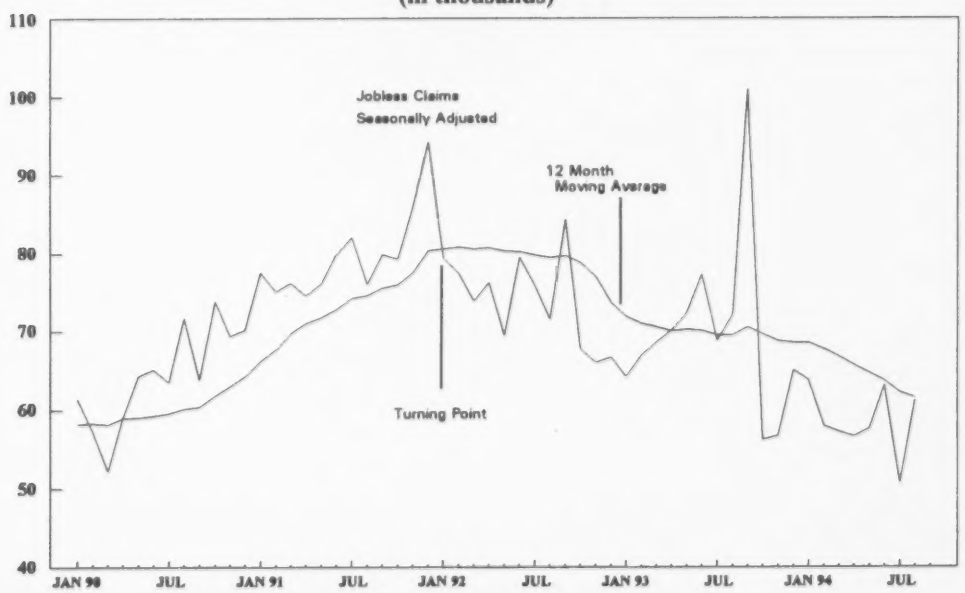
The Chicago Purchasing Managers Index, well into its zone of expansion, fell below its moving average in August. As with Housing Permits, the crossover was not strong enough to pull down the moving average.

Chicago Purchasing Managers Index (> 50 = Expansion)



Illinois labor markets were strong during the summer months as unemployment claims remained below their moving average.

Illinois Initial Jobless Claims: Seasonally Adjusted
(in thousands)

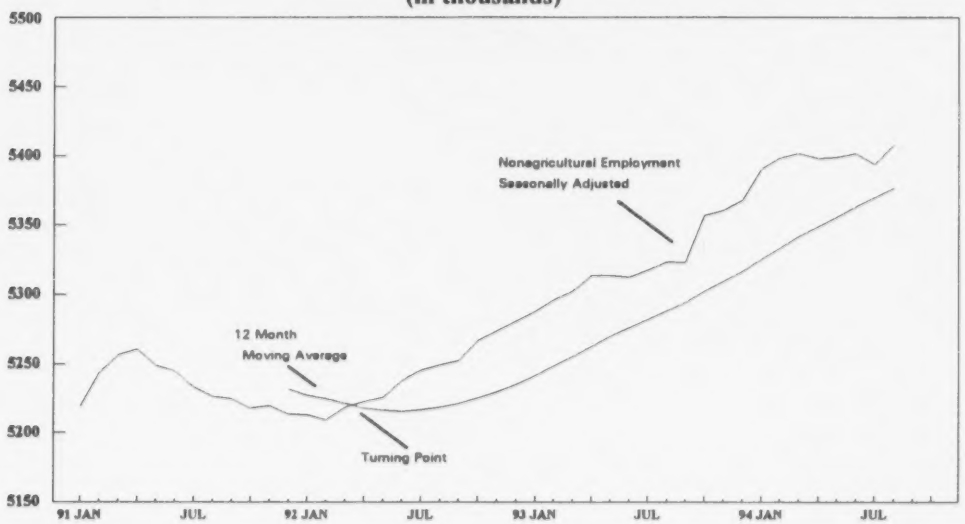


Leading indicators suggest the Illinois economy will continue growing.

CURRENT INDICATOR

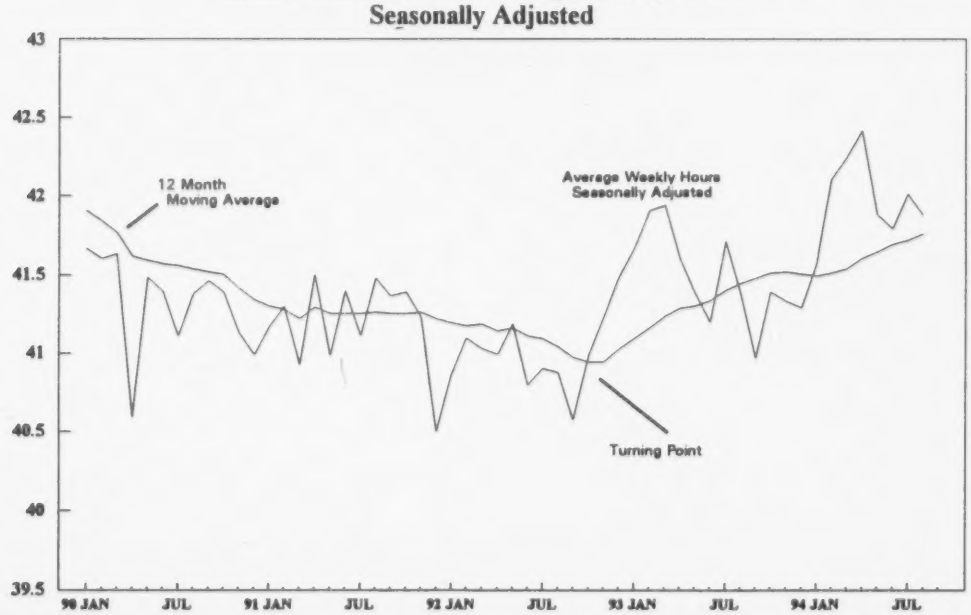
Even though seasonally adjusted nonagricultural employment in Illinois was relatively stagnant during the summer months the series is still above its moving average. This generally coincident indicator has not yet signaled a downward reversal in job growth although employment growth slowed during the period.

Illinois Nonagricultural Employment: Seasonally Adjusted
(in thousands)



LAGGING INDICATOR

Illinois Manufacturing: Average Weekly Hours
Seasonally Adjusted



Average weekly hours remain above their moving average and do not provide any indication that Illinois economic growth has turned down.

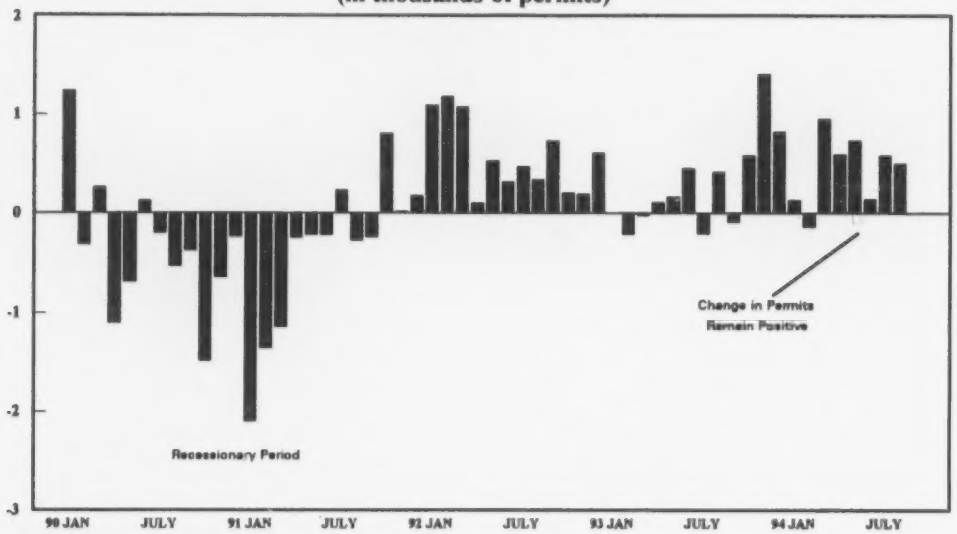
CHANGES IN THE INDICATORS

Some are suggesting that the Illinois economy is slowing down in response to recent interest rate increases. While this may now be the case, as it seems with some national indicators, the evidence of a slowdown in Illinois has not generally surfaced in the data series examined here.

Changes in Leading Indicators

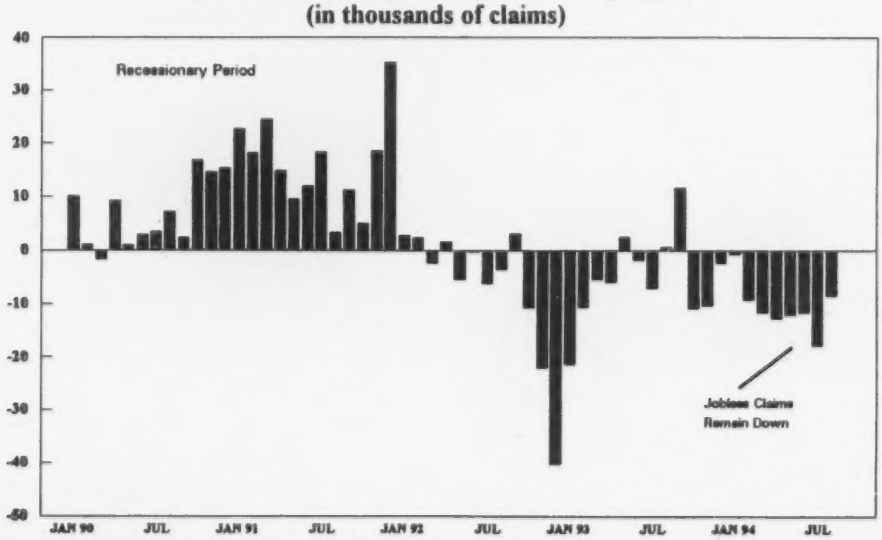
Housing permits relative to their levels one year ago are up and as recently as July did not suggest that permits were beginning a decline.

Illinois Housing Permits v. Year Ago Levels
(in thousands of permits)



Similarly, changes in Jobless Claims remain below year ago levels suggesting that labor markets are sufficiently strong and the expansion is continuing.

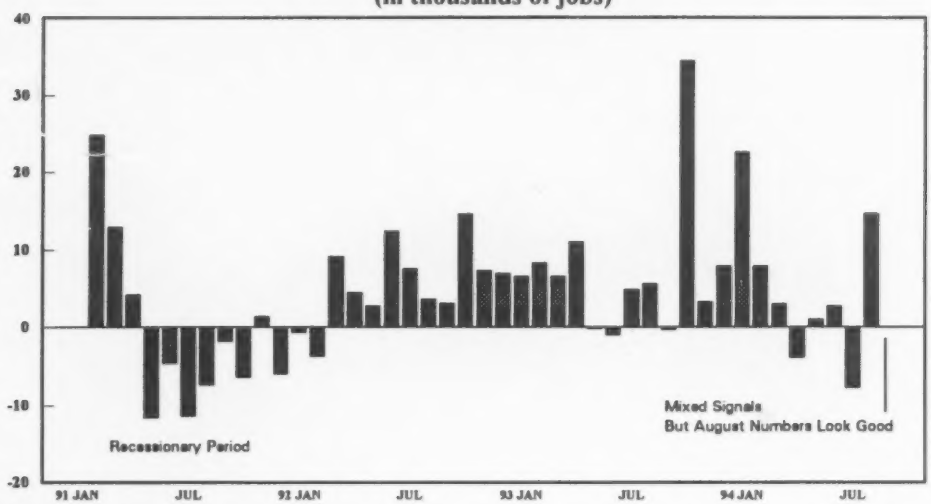
Illinois Initial Jobless Claims v. Year Ago Levels
(in thousands of claims)



Changes in the Current Indicator

Some slippage in the growth of housing permits and the Chicago Purchasing Managers Index might lead one to at least raise the issue of a slowing economy. The recent record of job creation adds a little more incentive to ask about the growth trend in Illinois. The month-to-month increases in seasonally adjusted nonagricultural employment, which have run up a fairly consistent string of advances, declined in April and July. Two dips do not make a trend but they do raise our attention and suggest that new employment numbers are worth watching.

Monthly Change in Nonagricultural Employment
(in thousands of jobs)



Changes in the Lagging Indicator

Hours worked remain high, and if this series is indeed a lagging indicator as it was in the last turning point, it has not confirmed a slow down.
